

The Study Cycle

The Study Cycle, adapted from Frank Christ's PLRS system by Sandra McGuire in her book *Teach Students How to Learn*, is a guide to help you build effective studying into your everyday life. On the surface, each step may seem obvious, but all too often students take shortcuts and miss important opportunities to benefit from the interplay of each step of the cycle. In the Study Cycle, each step builds on the previous one and distributes your learning throughout the semester, which is much more effective than waiting until the day before the test to study.

The Study Cycle

Step 1: Preview

Take a look at what you'll be covering during before you begin class. This will help you gain a sense of the big picture and anticipate how concepts fit together. You will get more out of class) if you already have some context for what you're about to learn, and you can come into class with questions that you expect will be answered.

Step 2: Attend class

Of course, going to class is an important step in the study cycle, but just being physically present isn't enough. Being attentive and engaged will help you get the most out of the experience. Class time is important, because this is when you get an understanding of the teacher's expectations and areas of focus (e.g., what's going to be on the test), which will help you figure out what to focus on during your study sessions later (steps 3 and 4). It's also a great opportunity to gain insight and intuition from your instructor and from other students in your class through asking questions and taking part in discussions.

During class, take notes in a way that will be useful to you. Taking notes by hand can help you remember the information—especially if you try to paraphrase in your own words. Try to stay off your phone/computer during class, unless you need it for an assignment. Keep track of your questions, and if you don't get to ask them during class, make a plan to go to discuss with your teacher at a later time.

Step 3: Review

Take some time after class to go back over your notes. You don't have to spend a long time doing this, but the sooner you do it the better. By reviewing soon after class, while the material is still fresh, you can fill in gaps and figure out what you might need help with. When you're reading back through your notes, make sure you're actively engaging with the material. Passively letting your eyes scan over the material won't actually help much. Instead, explain the material to yourself, summarize the key points, ask questions, and think about the big picture. Start to plan out how you might want to study the material you learned. Repeated exposure to the material helps you remember and understand it more effectively.

Step 4: Study and Complete your Assignments

Set up a daily schedule to work complete your assigned work or review your material. Brief but intense study sessions tend to be more effective than trying to study for many hours at a time. Figure out how long you can stay focused and efficient—it may be just 20 to 30 minutes, but it will probably vary depending on the material—and then plan study sessions of this length every day. By spreading your studying over time, you're studying much more effectively (this is called

The Study Cycle

“distributed practice”) and won’t have to try to do less-effective marathon study or work sessions before the exam or assignment is due. (also known as “massed practice”). Distributed practice helps you learn the material at a deeper level because you have more time to process it, see connections, and ask questions.

Step 5: Check

The last step is the one that a lot of people forget about. It’s important to check in with yourself to make sure what you’re doing is working and being open to changing your techniques if it’s not. After all, you wouldn’t want to spend a lot of time doing something that is not helping you learn. To make sure that your studying is effective, take a step back on a regular basis and ask yourself some:

- Does this answer make sense given the information provided?
- What strategy did I use to solve this problem that was helpful?
- How does this information conflict with my prior understanding?
- How does this information relate to what we learned last week?
- What questions will I ask myself next time I’m working these types of problems?
- What is confusing about this topic?
- What are the relationships between these two concepts?
- What conclusions can I make? Practice self-testing on a regular basis. Discuss what you’re learning with classmates. Check in with the learning objectives and make sure you are meeting them.
